Architecture

Glossary. Introduction.

HP WallArt is a new concept on the wall decoration with personalised designs. The main features of the model are:

1. Design personalisation through an advanced web designer.
2. Printed on ecological paper with an easy self-installation by the end user.

HP WallArt plug-in becomes a plug-in developed as a complement of the electronic WooCommerce to integrate the HP WallArt usefulness into WordPress providing to all the companies the option to create an e-commerce site based on the products customisation through the HP WallArt solution.
The main functions of this plug-in are:

1. Creation of products supported by HP WallArt.
2. Setting an image search engine on the Fotolia API.
3. Set the hooks and functions to adapt the process parameters to the process of buying WooCommerce.

To configure the system programming level we will consider the following actors in the system architecture:
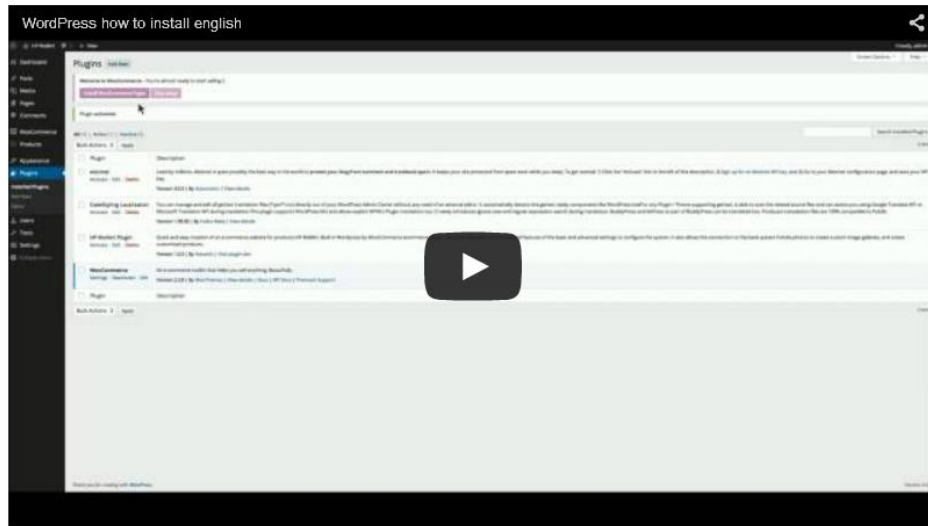

1. **End user**: becomes the customer that will be interacting with a web site and with the HP designer to customise his wall.
2. **E-commerce web site**: web site where the end user will be allowed to enter with a login to create projects, manage and pay for them.
3. **Project**: each request customised by the end user.
4. **Designer HP WallArt or simulator**: web space where the end user is able to place and compose a wall using different components.
5. **Background**: each image that the end user can select in every project as a wall background.
6. **Objects**: each image that the end user can overlap over the background of the project. They are vector images to increase or decrease in size without loss of quality.
7. **Text**: it is the option that the designer offers to customise texts over the background.

The system here exposed is configured on a server with the following characteristics:

- **Servidor Apache 2.0** http://www.apache.org
- **Programming language PHP 5.3.10** http://es.php.net
- **Database MySql 5.5.29** http://www.mysql.com
- **WordPress 4.0** https://www.wordpress.org
- **WooCommerce 2.2.8** http://www.woothemes.com/woocommerce
- **Virtue Theme or similar, compatible with WooCommerce** http://www.kadencethemes.com/product/virtue-free-theme
- **Library oauth-php revision 175** https://code.google.com/p/oauth-php
- **Administrator DDBB phpMyAdmin** http://www.phpmyadmin.net/home_page
- **Secure navigation SSL with certificate** https://www.geotrust.com
